

ECONOMIC BACKDROP IN A NUTSHELL AND GLOBAL ECONOMIC REVIEW AND SUMMARY

Developed economies

The coronavirus outbreak brings risks and uncertainties.

The coronavirus outbreak brings risks and uncertainties.

Before the outbreak, the US economy was picking up, and continues to create jobs and consumer confidence is high. Monetary policy should favour growth in the election year unless the virus affects supply chains for too long.

The Eurozone is more fragile due to dependence on Chinese demand, so the virus has a significant impact. The UK economy is in post-Brexit recovery. The Swiss franc will stay strong.

Japan and Australia will likely have a temporary impact from the virus.

The coronavirus outbreak obviously raises uncertainties on the global growth outlook, and poses downside risks to the encouraging dynamic at play since last autumn.

Before having tangible elements and data on the extent of the impact, the US economy was still on a path of slightly-above-potential expansion, supported by robust consumption and domestic demand, and a pickup in industrial activity indicators. The widely watched gauge of industrial activity, the ISM Manufacturing Index, bounced up from a 4-year low in January, signaling a resumption of the expansion in the sector after 5 months in the contraction zone. The economy continues to create jobs (225k in January) and consumer confidence is close to cyclical highs. As subdued inflation and coronavirus downside risks will likely keep the Fed on the cautious/accommodative side, monetary policy should favor economic growth in this election year, provided the virus outbreak doesn't affect supply chains, travel and activity for too long.

This analysis may also apply to Europe, although the Eurozone's situation is more fragile as it experienced a pronounced slowdown last year and several key sectors are very linked to China's demand (carmakers, luxury goods...). The sensitivity of Eurozone's economic activity to the coronavirus economic impact is therefore important, even if consumer confidence and domestic consumption still hold firm for the moment. The UK is experiencing some form of "relief recovery" after the dissipation of political uncertainties and the prospect of a significant fiscal stimulus to be announced in the spring. The SNB has had to face the strengthening CHF without really being able to react after it formally came under US watch for currency intervention.

In developed Asia, growth dynamics were mild but positive in Japan and in Australia, but the virus outbreak is likely to have at least a temporary negative impact on economic activity during Q1.

There are several elements that we know, and on which we can rely when forming a view.

Adrien Pichoud

Global growth momentum was indeed improving before the Coronavirus outbreak

Source: SYZ AM, Factset
Data as of 14.02.2020

All Asian countries are feeling the crunch from coronavirus in Q1. Time will tell how bad the damage is.

Emerging economies

All countries in Asia will experience a slowdown over Q1 as the coronavirus outbreak and the resulting travel restrictions, supply chain disruptions and precautionary measures will significantly impact economic activity. Obviously, since China is at the center of the outbreak it is likely to get hit the most, but all South-East Asian economies will be affected. It is difficult at the moment to estimate how deep and for how long the impact will be felt, but February and March economic data will help assess the situation.

The virus may not have a major impact on India, however.

Among the large emerging economies, India stands out as displaying strong economic growth. Being largely domestic-oriented, it may not be excessively impacted by the coronavirus outbreak and might continue to thrive in the months ahead, bolstered by supportive economic policies.

➤ ASSET VALUATION & INVESTMENT STRATEGY GROUP REVIEW

Risk and duration

Risk remains at “mild preference”. The coronavirus has not triggered recession concerns and a V-shaped rebound in Asian activity is likely.

Monetary policies in Asia will provide liquidity.

We expect a positive trend in the second half of the year.

Duration remains at “mild preference”. Duration can act as a hedge against risky assets.

The risk preference was left unchanged at “mild preference”. The potential impact of even a severe and sustained lockdown of large parts of the Chinese economy doesn’t appear sufficient to trigger or bring back global recession concerns at this stage. While a large-scale global spread of COVID-19 cannot be totally ruled out, the most likely scenario is one of a V-shaped rebound in Chinese and Asian activity after a temporary sharp drop.

Moreover, the monetary policy easing put in place in China and across most emerging market central banks (and if necessary, in developed markets, too) will nevertheless provide support and liquidity in the months ahead.

Therefore, our constructive scenario for global growth might experience a pause in the coming months with the resumption of a positive trend postponed towards the second half of the year.

On the duration front, our preference was also left unchanged at “mild preference”. Raising the duration level last month helped to mitigate the volatility of equity markets. But in this new “coronavirus” context, some exposure to duration is still a useful diversifier to hedge against risky assets. Even though valuations are more expensive than one month ago, they can be warranted as monetary policy expectations, central bank actions and their communications have been further tilted toward the dovish side.

The risk and duration stance has been kept unchanged at mild preference but US equities have been upgraded at the same preference level as Chinese equities.

Maurice Harari

Equity

Equity quickly rebounded after the coronavirus outbreak.

We only changed US status to “preference” because of strong macro momentum in US, Fed’s accommodative policy, and a likely re-election for Trump.

China remains attractive in terms of valuations.

We remain positive on bonds and credit.

Emerging market debt gets “mild disinclination” so exposure here would be in multi asset portfolio.

Russia, Indonesia, Mexico and Poland get “mild preference”.

Following the initial coronavirus outbreak, the equity market correction was rapidly offset by a rebound.

In this context, we did not bring any changes in the geographical allocation apart from upgrading the United States to “preference” on a par with China, making both markets our two top preferences.

The enhanced preference for US equities at valuations that are certainly not cheap but cannot be considered as outrageously expensive, either, is based on: (a) the resilience of the macroeconomic momentum of the US economy, (b) the support of the Fed’s accommodative monetary policy reinforced by the coronavirus outburst and (c) the now elevated probability of Trump’s re-election, which would be perceived positively by markets.

Finally, we chose to maintain our positive stance towards Chinese equity markets. We believe that there is no reason to give up now as valuations have become even more attractive and a significant monetary and fiscal stimulus may well be on the horizon.

Bond markets

We maintain a positive bias (“mild preference”) toward government bonds and credit as both are supported essentially by attractive relative valuation vs. cash, especially in EUR (and CHF).

We keep a “mild disinclination” score for emerging market debt (hard and local currency) with valuations being in the expensive camp. We therefore favour taking on emerging market exposure in a multi asset portfolio through equities rather than debt in the current environment. Nevertheless, on a standalone basis, emerging market debt is still likely to deliver positive total returns.

Moreover, in the emerging market debt local space, we raised our preference for Russia and Indonesia to “mild preference” along with Mexico and Poland. Overall valuation levels and the potential for some further rate cuts are supporting those markets.

Forex

Post-Brexit, sterling gets “mild preference”.

The British pound is still scored at “mild preference” after last year’s rather positive Brexit developments.

Gold is still top for diversification.

Gold remains the preferred alternative currency for the diversification it brings into portfolios (scored at “mild preference”).

Dollar is preferred over the euro.

The US dollar is favoured over the euro despite the greenback’s higher valuation since it offers a better growth outlook and especially a positive yield differential.

The yen is “mild preference.”

Finally, the Japanese yen is ranked at “mild preference” for its diversifier characteristic in a risk-off environment.
